

Silicate minerals

The relative abundance of elements in the Earth's crust (see table 1 below) determines what minerals will form and what minerals will be common. Of the 92 naturally occurring elements, Oxygen and Silicon are the most abundant elements in the Earth's crust as a result the silicate minerals are the most common minerals in the Earth Crust (see chart below). Silicates are further divided into six groups (see table 2 below)

Table 1. The most abundant (eight) elements in the Earth's crust

Element	Proportion of Earth's Weight (%)	Volume %
Oxygen	45.2	94
Silicon	27.2	9
Aluminum	8.00	
Iron	5.8	
Calcium	5.06	
Magnesium	2.77	
Sodium	2.32	
Potassium	1.68	
Total	98.03	
Other elements	1.97	
Total	100	100
